Nucleic Acids Res. 23:2127-2136 (1995).

-!- FUNCTION: TRANSCRIPTIONAL ACTIVATOR. BINDS TO THE INTERFERON-STIMULATED RESPONSE ELEMENT (ISRE) OF THE MHC CLASS I PROMOTER. BINDS THE IMMUNOSIOBLIAN LAMBDA LIGHT CHAIN ENHANCER, TOGETHER WITH PULL. PROBABLY PLAYS A ROLE IN ISRE-TARGETED SIGNAL TRANSUCTION MECHANISMS SPECIFIC TO LYMPHOID CELLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transcription regulation; DNA-binding; Nuclear protein; Activator; Alternative splicing.

Grossman A., Nicholl J., Antonio L., Luethy R., Suggs S.,
Sutherland G.R., Mak T.W.;
Submitted (OCT-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Transcriptional activator. Binds to the interferonstimulated response element (ISRE) in IFN promoters and in the Q promoter (Qp) of EBV nuclear antigen-1 (EBNA1) (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SMART; SM00348; IRF; 1.

"CIRF-3, a new member of the interferon regulatory factor (IRF) family that is rapidly and transiently induced by dsRNA.";
Wucleic Acids Res. 23:2137-2146(1995).
-! FUNCTION: May activate transcription by complex formation with other transcriptional factors, possibly members of the STAT family. Binds specifically to the IFN-stimulated response element (ISRE) but not to the IFF-1 binding site PRD-I.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- SIMILARITY: Belongs to the IRF family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           There are no restrictions on ng as its content is in no

MEDLINE Grown of Company factor 3 (IRF3) to chromosome 19913.3-13.4 by an intragenic polymorphic marker.";
Mun. Hum. Genet. 6:231-234(1998).
-! FUNCTION: May activate transcription by complex formation with other transcriptional factors, possibly members of the STAT family. Binds specifically to the IFN-stimulated response element (ISRE) but not to the IRF-1 binding site PRD-I.
